\_\_\_\_\_\_

Total time: 0.000090 sec

R = 4 vs various N:

N	Time (with R=4) (sec)
15	0.000090
100	0.002050
1000	0.05490

### N = 1k for various R:

	R	Time (with $N = 1000$ ) (sec)
- 1		

4	0.05490
8	crash
16	crash
32	crash

The code runs well under all circumstances except that of 8+ ranks. I would expect the values for 8, 16, 32 to be faster and faster, but drop off towards 32, since at that point diminishing returns are likely reached.
